We'll give you one set of 750 Turbo power up parts, formerly I promised you. I'm very sorry I have no time to translate for you. Would you please ask Mr. Yamaguchi?

1. Take off the air intake pipe before Compressor and instead of that, please install new air funnel.
2. Peel off the taping of EGI harness of air temp sensor, then brown wire loop comes out.

Cut off it, and insert 4.0K Ω resistor.

it makes air fuel mixture 11.5% richer at max speed.

3. If you feel too rich, then, please exchange resistor smaller 4.0K Ω \rightarrow 3.5K Ω \rightarrow 3.0K Ω .

4. also, we recommend modifying exhaust silencer to decrease exhaust back pressure.

If you have any question, please give us telex.

Anyway please try once.
